

# **Minimizing and Managing Potential Impacts of Injection-Induced Seismicity from Class II Disposal Wells: Practical Approaches**

Philip Dellinger, Chief  
Ground Water/UIC Section  
EPA Region 6

## **Presentation Summary**

- National Technical Workgroup Background
- Overview of study approach
- Discussion of engineering tools
- Summary of findings and recommendations

## UIC National Technical Workgroup

- Established in 1997 to:
  - Tap national expertise in the resolution of technical issues.
  - Foster exchange of technical and programmatic information specific to the UIC program.
- NTW is not a policy or rule-making body.
- Comprised of staff from each EPA Regional Office, EPA Headquarters, and six state agencies.
  - Current state members are Ohio DNR, Texas CEQ, Florida DEP, Oklahoma DEQ, Wyoming OGCC, Alabama DEM
  - Other external expertise solicited on project by project basis.

# Acknowledgments

## State Working Group Members

- Lawrence Bengal, Arkansas Oil and Gas Commission
- Douglas Johnson, Railroad Commission of Texas, retired
- Charles Lord, Oklahoma Corporation Commission
- James A Peterson, West Virginia Department of Environmental Protection
- Tom Tomastik ,Ohio Department of Natural Resources, retired
- Chuck Lowe, Ohio EPA
- Jim Milne, Colorado Oil and Gas Conservation Commission
- Denise Onyskiw, Colorado Oil and Gas Conservation Commission, retired
- Vince Matthews, Colorado Geologic Survey, retired

## Expert Review Panel

- Brian Stump, Southern Methodist University
- Chris Hayward, Southern Methodist University
- Scott Ausbrooks, Arkansas Geological Survey
- Steve Horton, Center for Earthquake Research and Information, U of Memphis
- Ernest Majer, Lawrence Berkeley National Laboratory
- Norman Warpinski, Pinnacle
- John Satterfield, formerly with Chesapeake Energy
- Cliff Frohlich, University of Texas Institute for Geophysics,
- David Dillon, National Academy of Science
- Shah Kabir, Hess Energy
- Bill Smith, National Academy of Science, retired
- Roy Van Arsdale, University of Memphis
- Justin Rubenstein, USGS

## Final Peer Review Panel

- Jeff Bull, Chesapeake Energy Corporation
- Robin McGuire, Lettis Consultants International, Inc.
- Craig Nicholson, University of California, Santa Barbara
- Kris Nygaard, ExxonMobil
- Heather Savage, Lamont-Doherty Earth Observatory, Columbia University
- Ed Steele, Swift Worldwide Services

# Presentation Summary

- National Technical Workgroup Background
- Overview of Study Approach
- Discussion of engineering tools
- Summary of findings and recommendations

# Overview of Study Approach

- Literature review and compilation
- Analysis of four case examples
- Development of decision model
- Fundamentals of induced seismicity
- Explore petroleum engineering methods

# Overview of Study Approach

- Literature review and compilation
- Analysis of four case examples
- Development of decision model
- Fundamentals of induced seismicity
- Explore petroleum engineering methods

# Overview of Study Approach

- Literature review and compilation
  - Peer reviewed material only
  - Comprehensive, but moving target

# Overview of Study Approach

- Literature review and compilation
- **Analysis of four case examples**
- Development of decision model
- Fundamentals of induced seismicity
- Explore petroleum engineering methods

## Overview of Study Approach

- Analysis of four case examples
  - Central Arkansas Area
  - North Texas Area
  - Braxton County, West Virginia
  - Youngstown, Ohio

# Overview of Study Approach

- Analysis of four case examples
  - Geologic site summary
  - History of seismicity
  - State actions
  - Application of reservoir engineering methods
  - Lessons learned

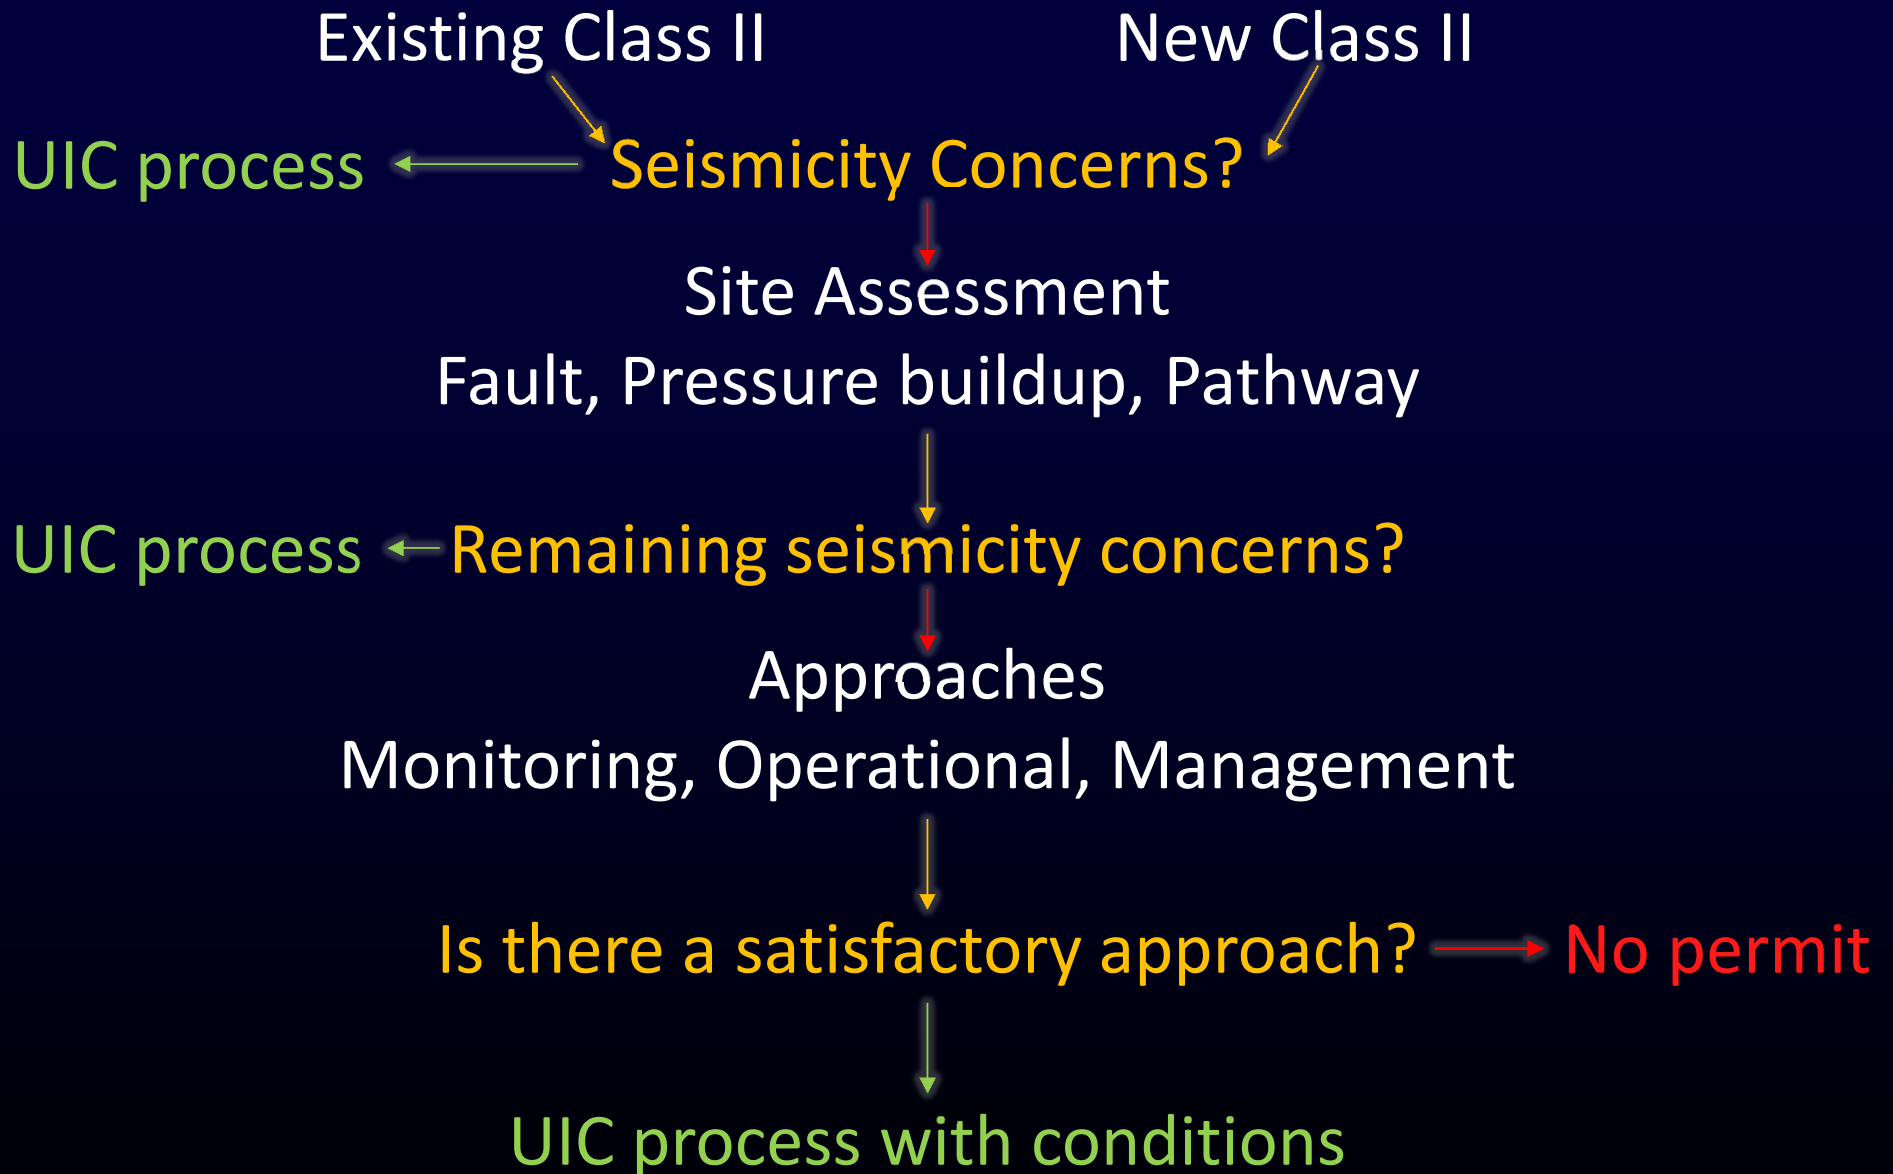

# Overview of Study Approach

- Literature review and compilation
- Analysis of four case examples
- **Development of decision model**
- Fundamentals of induced seismicity
- Explore petroleum engineering methods

# Overview of Study Approach

- Development of decision model
  - Received much input throughout process
  - Comprehensive thought process - not specific
  - Founded on Director Discretionary Authority

# DECISION MODEL FOR UIC DIRECTORS

# Overview of Study Approach

- Literature review and compilation
- Analysis of four case examples
- Development of decision model
- **Fundamentals of induced seismicity**
- Explore petroleum engineering methods

# Overview of Study Approach

- Fundamentals of induced seismicity
  - Captures a broader potential audience
  - Provides a general reference
  - Includes geoscience and engineering aspects

# Overview of Study Approach

- Literature review and compilation
- Analysis of four case examples
- Development of decision model
- Fundamentals of induced seismicity
- Explore petroleum engineering methods

# Presentation Summary

- Overview of Study Approach
- Discussion of engineering tools
- Summary findings and recommendations

## Discussion of Engineering Tools

- No previous application identified.
- Key points.
  - Quality of data is crucial.
  - These methods are an interpretive tool, not a fix-all.
  - Pressure buildup can be transmitted over great distances:
    - Multiple disposal wells in same formation and geographic area;
    - Individual wells in fracture flow dominated injection formations.
  - PE tools can determine if fracture flow is predominant.
  - PE tools can detect reservoir changes at distance, including faults.

# Discussion of Engineering Tools

- Two fundamental approaches
  - Well testing
    - Pressure transient or falloff testing can determine if a reservoir is fractured, as well as static formation pressure.
    - Function of near well conditions.
  - Analysis of operational data
    - Hall plots using operational data (rates and pressures) indicate changes in transmissivity (ease of injection) at distance.
    - Covers both near wellbore and distance increasing with time.

## Discussion of Engineering Tools

- In some cases, correspondence between well behavior and seismic events is exhibited in Hall Plot analyses.

# Presentation Summary

- Overview of Study Approach
- Aspects of engineering tools
- Summary of findings and recommendations

# Summary of Findings and Recommendations

- Take a proactive approach.
  - Realistic analysis instead of definitive proof.
  - Monitor seismicity trends in regional area.
    - Magnitude and frequency
- Engage operators early.
  - Additional site geologic data
  - Voluntary actions
  - Increased operational data
- Engage external expertise if warranted.
- Modify operations if warranted.

# Summary of Findings and Recommendations

- Perform multi-disciplinary characterization of site (injection reservoir testing, analysis, consultation, literature).
- Case examples – deep fractured reservoirs.
  - Fractures more likely to communicate pressure buildup long distances.
  - Buildup can be directional and extend miles.
  - Fractured reservoirs can result in communication with basement rocks, lower confining strata is important.

# Summary of Findings and Recommendations

- Assure high quality operational data.
- Permitting contingencies (traffic light approach) are an excellent tool to address site uncertainties.
- Increased seismometers better define seismic activity.

## Current EPA Activities

- Multi-Agency Collaborative on Unconventional Oil and Gas Research.
  - Coordinate on-going and future, high-priority research associated with developing onshore shale gas, tight gas, shale oil, and tight oil resources.
  - One of the areas of interest is induced seismicity.
    - Goal of this subgroup is to better understand the potential risks, causes, and effects throughout the unconventional oil and gas development and production life cycle.
    - Current members are DOE, USGS, and EPA.
- Exploring Development of Induced Seismicity Training Module.

# Minimizing and Managing Potential Impacts of Injection-Induced Seismicity from Class II Disposal Wells: Practical Approaches

Philip Dellinger, Chief, Ground Water/UIC Section; EPA Region 6

## Purpose

Provides the UIC Director with tools for minimizing and managing induced seismicity on a site-specific basis, using available Director discretionary authority.

The authority used to address potential USDW risks from seismic events could include:

- Loss of disposal well mechanical integrity;
- Impact to various types of existing wells;
- Changes in USDW water level or turbidity;
- USDW contamination resulting from fluid movement through faults, wellbore damage, or earthquake-damaged surface sources.

## National Technical Workgroup Tasks

1. Compare parameters identified as most applicable to induced seismicity with the technical parameters collected under current regulations.
2. Prepare a decision model.
3. Assess applicability of pressure transient testing and/or pressure monitoring techniques.
4. Summarize lessons learned from case studies.
5. Recommend measurements or monitoring techniques for higher risk areas.
6. Analyze applicability of conclusions to other well classes.
7. Recommend specific areas for further research needed.

## Critical Components

### Pressure buildup

- An increase in the formation pore pressure from disposal activities.

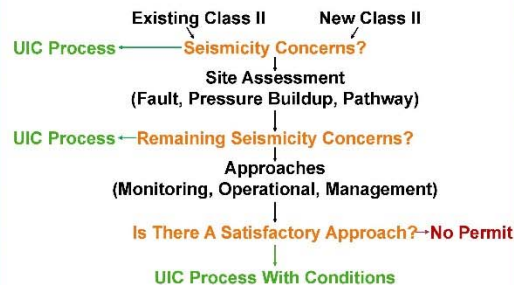

### Faults of Concern

- Optimally oriented for movement, and under critical stress.
- Sufficient size for movement to potentially cause a significant earthquake.
- May be a single fault or a zone of multiple faults and fractures.

### Pathway

- A permeable avenue (matrix or fracture permeability) allowing the pore pressure increase to reach the fault.

## Decision Thought Process

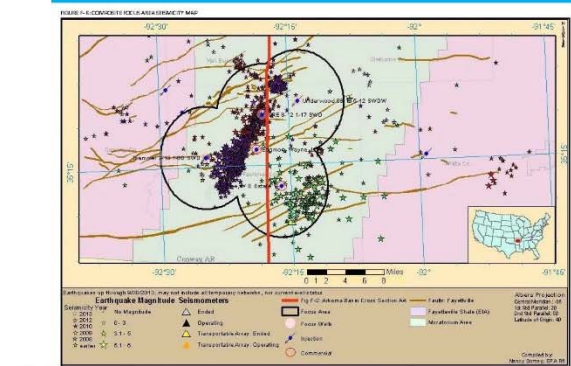

## Work Flow and Action Plan

## Multi-Disciplinary Site Assessment

Information Needed	Source
Regional and Local Seismicity	USGS or state agency catalog; event accuracy, seismometer spacing
Detailed Well Information	Permit and other well files, including daily disposal volumes and pressures
Geologic Setting	Maps, cross-sections, permit application, seismic surveys, publications
Reservoir Characterization	Core analysis, well tests, well logs, hydraulic fracture results, publications
Reservoir Pressure	Static pressure: gauge or fluid level
Flow Character	Analysis or modeling
Pathway	Analysis or test results
Stress Direction	Borehole breakout, production logs

## Site Example

- The Director acquired additional site information, requested action from operators, and prohibited disposal operations. Specific examples include:
- Increased monitoring and reporting requirements for disposal well operators to provide additional operational data for reservoir analysis.
  - Required one well to install a seismic monitoring array prior to disposal as an initial permit condition.
  - Required plugging or temporary shut-in of suspect disposal wells linked to injection-induced seismicity while investigating or interpreting additional data.
  - Defined a moratorium area prohibiting Class II disposal wells within a defined high risk area of seismic activity.

## Petroleum Engineering Analysis

## Report Conclusions

- Be proactive rather than requiring definitive proof.
- Utilize multi-disciplinary approaches.
- Understand that pressure can be transmitted miles through fractures.
- Apply established engineering tools using high quality data.
